

Functioning of Finnish gas market

What is working well in the Finnish wholesale market?

we have gas

Continuity

Daily operations

Gas supply is working

Rules are followed. In current situation rules not necessarily meet market needs

Market based mechanisms are applied consistently.

Secondary market could be more liquid. Also TSO should be allowed to have some gas inventories to avoid balancing actions in the opposite directions two days in a row.

It could be reasonable to set up a floor and cap for balancing gas prices. Balancing gas sell price 10-15 EUR/MWh when TTF is 45 EUR/MWh is not very user-friendly

Where do you see room for improvements?

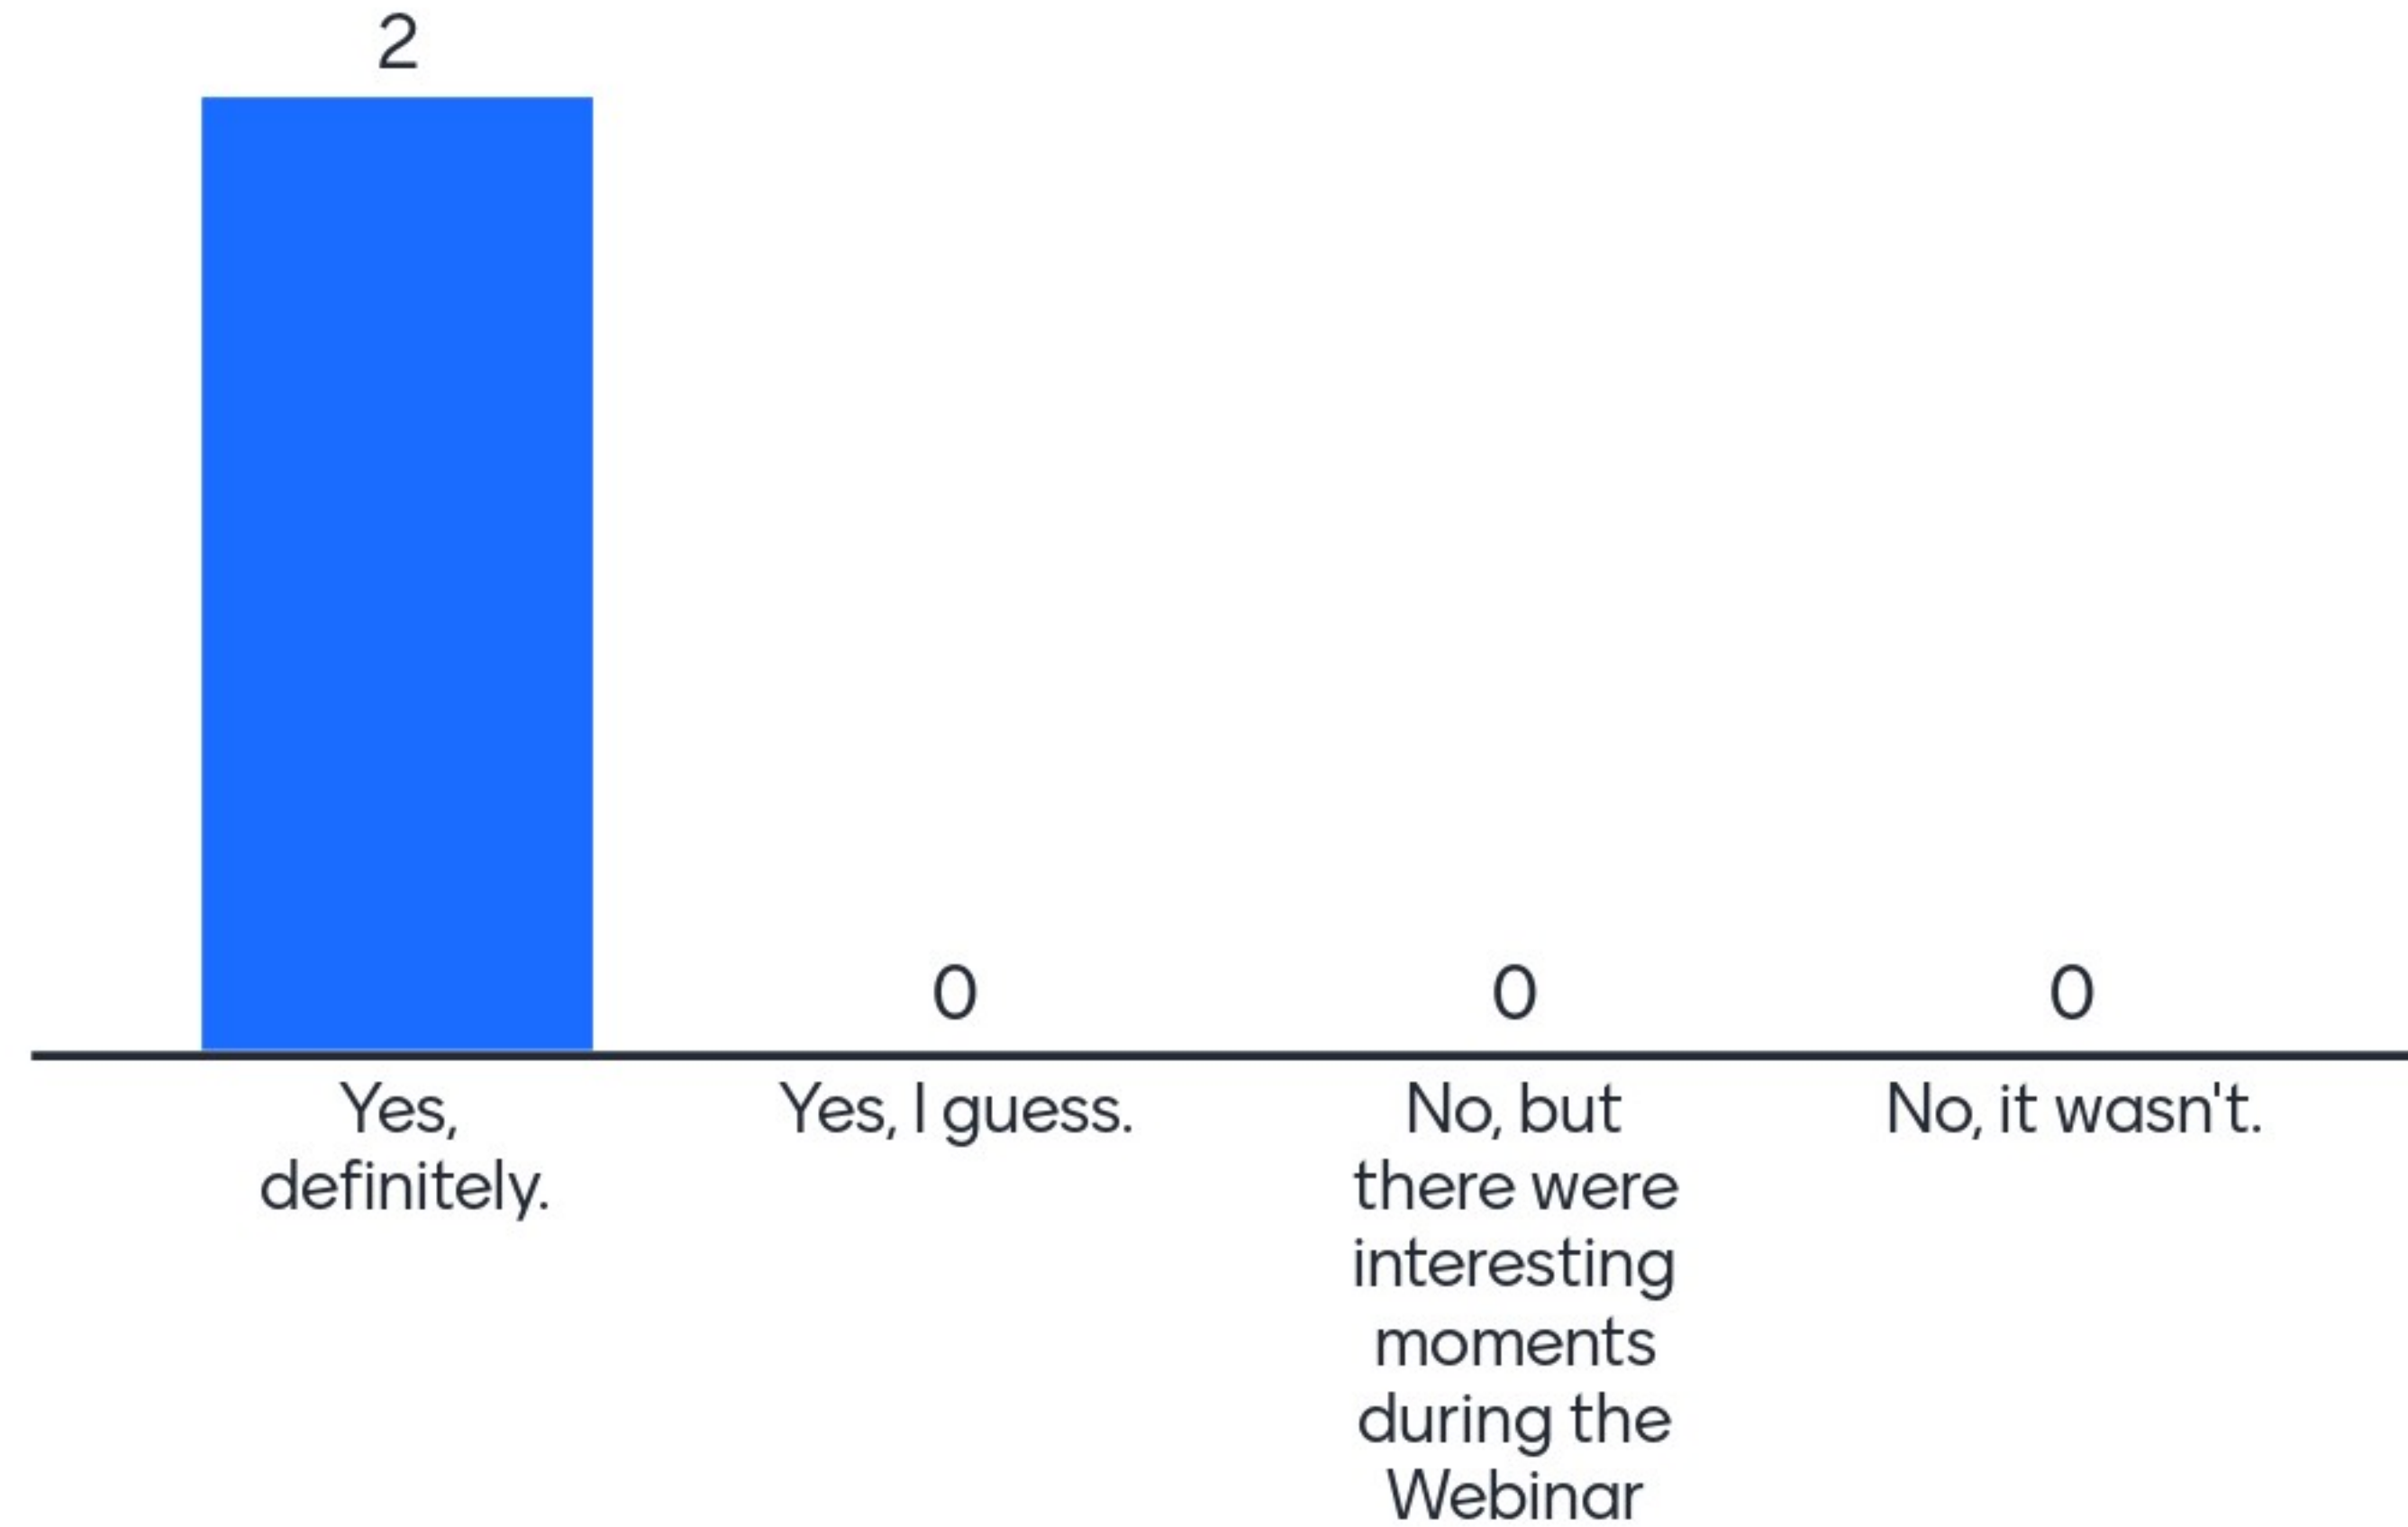

Flexibility at the market

Gasgrid should consider switching to the same portal developer as Elering, Conexus and AmberGrid did. That would make a lot of synergies and make the behavior of gasgrid portal way more predictable.

Increase information availability: publish consumption data, inkoo terminal data

Under the secondary market liquidity it was meant the commodity itself. Current set-up might be open to market abuse due to low number of LNG importers
